controlling interest in Vermont Electric Power )  
Company, Inc. )

DIRECT TESTIMONY OF  
ASA HOPKINS  
ON BEHALF OF THE  
VERMONT DEPARTMENT OF PUBLIC SERVICE

January 20, 2011

Summary: The purpose of Dr. Hopkins' testimony is to address the following criteria that the Department believes the Board should apply in evaluating the Petition: technical competence, fairness as a partner, suitability of buyer, compatibility of service territories, effect on employees and consistency with 2005 Vermont Electric Plan. In addition, Dr. Hopkins's testimony will address some proposed uses for the "Windfall Mechanism" that CVPS must provide as a result of this proposed transaction.

Direct Testimony  
of  
Asa Hopkins

1 Q. Please state your name and occupation.

2 A. My name is Asa Hopkins, and I am the Director for Regulated Utility Planning  
3 with the Vermont Department of Public Service (“the Department”). My  
4 responsibilities include direction of overall energy planning activities for the  
5 Department and the State of Vermont.

6

7 Q. Please describe your educational background and experience.

8 A. I have a B.A. in Physics from Haverford College, and a Masters Degree and  
9 Doctor of Philosophy in Physics from the California Institute of Technology. I  
10 have worked at the Department for about four months. Prior to joining the  
11 Department, I was an American Association for the Advancement of Science  
12 (AAAS) Science and Technology Policy Fellow at the U.S. Department of  
13 Energy, where I worked in the office of the Undersecretary for Science, Dr.  
14 Steven Koonin. Prior to that, I was a postdoctoral fellow in the Environmental  
15 Energy Technologies Division at Lawrence Berkeley National Laboratory.

16

17 Q. Have you testified before the Public Service Board before?

18 A. No, although I have also filed testimony in Docket 7815 today.

19

1 **I. INTRODUCTION AND SUMMARY OF TESTIMONY**

2 Q. What is the purpose of your testimony?

3 A. My testimony summarizes the Public Service Department's review of the  
4 Amended Joint Petition of Central Vermont Public Service Corporation, Danaus  
5 Vermont Corp., Gaz Métro Limited Partnership, Gaz Métro Inc., Northern New  
6 England Energy Corporation for itself and as agent for Gaz Métro Limited  
7 Partnership's parents, Green Mountain Power Corporation and Vermont Low  
8 Income Trust for Electricity, Inc. for approval of: (1) the merger of Danaus into  
9 and with Central Vermont, (2) the acquisition by Northern New England of the  
10 common stock of Central Vermont, (3) the amendment to Central Vermont's  
11 Articles of Association, (4) the merger of Central Vermont into and with Green  
12 Mountain, and (5) the acquisition by VLITE of a controlling interest in Vermont  
13 Electric Power Company, Inc. In addition, I address certain of the criteria  
14 applicable to regulatory review of the proposed transactions. Specifically I  
15 address technical competence, fairness as a partner, suitability of buyer,  
16 compatibility of service territories, effect on employees and consistency with  
17 2005 Vermont Electric Plan.

18 Q. What are the Department's conclusions regarding the proposed transaction?

19 A. In general, through testimony of John Wilson and Michael Dworkin, we  
20 have identified areas of Petitioners' merger proposal that the Department  
21 believes deserve modification in order to meet the general good standard set

1           forth in statute. I will not summarize those concerns and recommendations  
2           separately here.

3                     Apart from those concerns and recommendations, we have concluded  
4           that the transaction satisfies the following criteria: technical competence,  
5           fairness as a partner, suitability of buyer, compatibility of service territories,  
6           effect on employees and consistency with 2005 Vermont Electric Plan.

7                     In addition, it is the Department's position that the proposal set forth in  
8           the Petition for the satisfaction of the Board's requirement in Public Service  
9           Board's Order in Docket Nos. 6460/6120, June 26, 2001 does not meet the  
10          Order's standard as a legal matter. In that regard, I have reviewed the testimony  
11          submitted by AARP and find the arguments presented persuasive regarding why  
12          any clawback based upon the Order should be additive to, rather than included  
13          within, merger savings that are otherwise achieved. While I do not offer my  
14          own opinion on that issue here, leaving it to the Department legal briefing in  
15          this docket, I offer testimony below relating to other mechanisms that the  
16          Department believes can satisfy the terms of that Order.

17

18   **II.    CRITERIA**

19   Q.    On which of the criteria that board considers in evaluating proposed mergers  
20          and acquisitions will you be submitting recommendations?

21   A.    I will be submitting recommendations on the following criteria:

22          (1)    Technical Competence;

- 1 (2) Fairness as a Partner;  
2 (3) Effect on Employees, and  
3 (4) Consistency with the 2005 Vermont Electric Plan.  
4

5 **A. Technical Competence**

6 Q. Have the Petitioners demonstrated that the acquiring entity has sufficient  
7 technical competence?

8 A. Yes. As noted by the Board in its Final Order in Docket 7213 approving the  
9 acquisition of GMP by Gaz Metro, “[a] determination of technical competency  
10 requires an assessment of the surviving company's ability to operate the electric  
11 system in a safe and reliable manner while charging customers just and  
12 reasonable rates.”<sup>1</sup> While GMP had some difficulties in the mid-1990s, since  
13 then it has generally been operated well in terms of rates and service quality.

14 As noted by the Board in the Gaz Metro Merger Docket,

15 NNEEC also has a proven record of technical, financial and managerial  
16 competency through its twenty-year ownership of Vermont Gas  
17 Systems, Inc. Under NNEEC's ownership, VGS has increased its firm  
18 customer base from approximately 18,000 in 1990 to 37,000 in 2005.  
19 VGS also has complied with Board Rules and Orders. Thus, NNEEC  
20 and its parent, Gaz Métro, have a well-documented and an established  
21 track record for operating regulated and unregulated businesses in  
22 Vermont.

---

*1 Joint Petition of Green Mountain Power Corporation, Northern New England Energy Corporation (NNEEC), a subsidiary of Gaz Metro of Quebec, and Northstars Merger Subsidiary Corporation (Northstars) for approval of: (1) the merger of Northstars into and with Green Mountain Power; (2) the acquisition by NNEEC of the common stock of Green Mountain Power; and (3) the amendment to Green Mountain Power's Articles of Incorporation Docket 7213 (“Gaz Metro Acquisition Docket”), Order of 3/26/07 at 23.*

1 Gaz Metro Merger Docket, Docket 7213, Order of 3/26/07 at 24.

2 Since Gaz Metro acquired GMP in 2007, GMP, NNEEC and Gaz Metro have  
3 continued to demonstrate the “ability to operate the electric system in a safe and  
4 reliable manner while charging customers just and reasonable rates.”

5 **B. Fairness as a Partner**

6 Q. Have the Petitioners demonstrated that the acquiring entity will demonstrate  
7 fairness as a partner?

8 A. Yes. The Board has noted that “[a] significant component of this consideration  
9 is whether the proposed merger transaction would result in any material changes  
10 in the management structure or any other operations of the surviving  
11 corporation.” Gaz Metro Merger Docket, Docket 7213, Order of 3/26/07 at 27.

12 The proposed transaction does call for some changes in management  
13 structure, in that a number of officers from the acquired corporation, CVPS, will  
14 leave the Combined Company. However, since the acquiring company has an  
15 established track record in Vermont, the Department does not anticipate that  
16 these management changes will lead to any negative impacts on the operations  
17 of the Combined Company. The operational efficiencies achieved by the  
18 Combined Company will result in ratepayer savings.

19 Further, as noted above, the experience to date with NNEEC and Gaz  
20 Metro with relation to VGS and GMP supports the notion that the acquiring  
21 company will demonstrate fairness as a partner. Coupled with the measures  
22 being proposed by the Department in conjunction with the future governance of

1 VELCO, the financial restrictions suggested in the Department's testimony by  
2 John Wilson, and the continuing regulatory oversight of the Combined  
3 Company, I believe that this criterion is satisfied.

4 **C. Effect on Employees**

5 Q. Do you have an opinion as to the effect on employees of this proposed  
6 transaction?

7 A. Any merger of state utilities will lead to consolidation of operation and  
8 efficiencies; these aspects of a merger are critical to achieve ratepayer benefit.  
9 Nevertheless, job loss must be viewed in light of the general good of the state.  
10 Petitioners have proposed a reasonable process whereby savings will be  
11 acquired without layoffs (aside from a few senior executives) or forced  
12 relocations. The recent Memorandum of Understanding between GMP and the  
13 City of Rutland further solidifies these commitments. While a faster path to  
14 such savings would be possible, the proposal eases job loss concern in a manner  
15 that the Department views as positive for the general good of the state. The  
16 Department supports the Petitioners' proposal and believes it satisfies the  
17 criteria regarding effect on employees.

18 In addition, GMP and CVPS employees already collaborate regularly  
19 throughout Vermont where the utilities have adjoining service territories, so I  
20 believe that workforce integration will not cause undue strain on the employees  
21 of either company. I agree with the Petitioners that the combined utility is likely

1 to be a dynamic company and provide a good work environment, based upon  
2 the acquiring company's history to date.

3 **D. Consistency with the 2005 Vermont Electric Plan.**

4 Q. Have the Petitioners demonstrated that the proposed transaction is consistent  
5 with the 2005 Vermont Electric Plan?

6 A. Yes. The 2005 Vermont Electric Plan states, in part, that “[c]ontinued  
7 consolidation of both large and small companies, or opportunities for shared  
8 service capacities, to achieve competitive economies of scale, may be desirable  
9 over this 20 year planning period.” Consolidation of GMP and CVPS, with  
10 appropriate conditions as sought by the Department, would be consistent with  
11 the 2005 Plan. The 2011 Vermont Electric Plan is embodied in the recently  
12 finalized 2011 Comprehensive Electric Plan. I believe it is most fair to hold the  
13 Petitioners to consistency with the 2005 Electric Plan, as that plan was the plan  
14 in effect at the time of Petitioners’ filing. The 2011 Electric Plan is silent on the  
15 question of utility consolidation, so the merger of these utilities is not  
16 inconsistent with that Plan. Moreover, during 2011 the Department supported  
17 two other utility consolidations (Vermont Marble and Readsboro) and continues  
18 to believe that consolidations can provide opportunities for ratepayer benefits.

19

1           **III.    Windfall Mechanism**

2    Q.    Do you have an opinion as to options available to Petitioners that would satisfy  
3           the Board’s Order in Docket Nos. 6460/6120, June 26, 2001 (the “windfall”)?

4    A.    In this testimony I will summarize a number of different options for what  
5           Petitioners could do with the “windfall” funds required by the Board’s Order,  
6           along with some pros and cons for each as appropriate. I do not intend to  
7           suggest that there is a single, correct disposition of the windfall funds. I  
8           understand that the Department will submit briefs regarding any legal questions  
9           regarding the Order. Instead, one could think of my testimony as addressing the  
10          question: “What options would you consider to achieve benefits for CVPS  
11          ratepayers, supported by approximately \$21 million in windfall funds and based  
12          on the Board’s Order?”

13   Q.    Are there general principles that should guide the disposition to CVPS  
14          ratepayers?

15   A.    I would hold to four main principles:

16          1) The benefits returned to CVPS ratepayers should accumulate in rough  
17          correspondence, by ratepayer class, to the monies paid in through higher rates.  
18          That is, commercial ratepayers as a class should receive benefits in the same  
19          proportion to their contribution through higher rates, as should residential

1 ratepayers. It may not be practicable to divide the universe of CVPS ratepayers  
2 into many separate classes, but broad class contributions should be respected.

3 2) The windfall should be used to leverage other investment, thereby creating  
4 greater benefit for ratepayers. Program design choices that increase the leverage  
5 and return on each dollar of windfall investment should be favored over those  
6 that do not leverage this investment. In all cases, verified benefit to CVPS  
7 ratepayers should be required.

8 3) Just as we ask utilities to consider economic and environmental costs when  
9 undertaking least cost planning, the windfall funds should provide both  
10 economic and environmental benefits to CVPS ratepayers and to Vermonters as  
11 a whole.

12 4) Where possible, the windfall funds should leverage existing organizations  
13 and entities to deliver benefits and services to ratepayers. Creating additional  
14 organizations or financial entities could increase customer confusion and result  
15 in administrative costs and duplication, reducing ratepayer benefits.

16 Q. What are some windfall-sharing options that could align with these principles?

17 A. The first choice to make is whether the windfall should be returned to  
18 ratepayers as money (such as cash or bill credits) or if it should instead be  
19 directed toward other, energy-related purposes that benefit CVPS customers. (I  
20 am not going to discuss non-energy-related options other than the direct refund.)

1 The energy-related purposes include a number of options to advance energy  
2 efficiency and renewable energy, which help ratepayers through energy savings  
3 and energy security.

4 I will address the pros and cons of the money option first, and then  
5 discuss the other potential purposes in greater detail.

6 Q. Should the windfall monies be returned to ratepayers directly as money, such as  
7 through bill credits?

8 One simple option for the windfall would be to return the money as  
9 checks, cash, or bill credits to CVPS ratepayers. In order to do this, a formula  
10 would need to be derived to determine the amount of windfall to be returned to  
11 each ratepayer. It is practically impossible that each ratepayer would see exactly  
12 the same return as they paid in higher rates; this is also true of each of the other  
13 options described later in my testimony. One advantage of this option is that  
14 each ratepayer could expect to receive some return. A “back of the envelope”  
15 calculation based on 2010 CVPS ratepayer data indicates that the average  
16 residential ratepayer could receive a return of about \$69, the average  
17 commercial ratepayer about \$355 and the average industrial customer about  
18 \$100,000.<sup>2</sup> Some households, businesses, or industrial concerns use more

---

2 These figures are generally consistent with those presented in AARP’s testimony. To provide some context, the average residential ratepayer return of about \$69 is roughly \$20 less than an average monthly residential bill, the average commercial ratepayer payment of about \$355 is approximately \$50 more than an average monthly commercial ratepayer bill, and the average industrial customer refund of about \$100,000 is approximately \$20,000 more than an average monthly industrial ratepayer bill.

1 electricity than others, and would receive larger refunds if the refunds were  
2 individualized; others would receive smaller refunds. The administrative  
3 overhead to determine the correct amount to refund to each ratepayer could also  
4 be considerable.

5 The most striking disadvantage of this option is that it fails to leverage  
6 the windfall with other private or public funds to produce lasting benefit to  
7 CVPS ratepayers, and fails to use these limited funds to return even greater  
8 value to CVPS ratepayers over time. As recognized by the Board in its Order  
9 approving the windfall mechanism, CVPS ratepayers contributed more than \$16  
10 million (or about \$21 million, adjusted for inflation) to help CVPS.<sup>3</sup> A simple  
11 return of the windfall funds risks losing the opportunity for CVPS ratepayers to  
12 receive benefits worth closer to the actual value of their assistance.

13 Q. What are options that would increase the leverage of the windfall?

14 A. The windfall funds can produce lasting benefit greater than a direct refund  
15 through capital investments in infrastructure that produces continuing returns  
16 for ratepayers. An example would be investment in energy efficiency.  
17 Increasing energy efficiency generally requires upfront investment and  
18 generates a return by lowering energy bills over time. The economic benefit of  
19 increasing efficiency can much more than pay for the upfront cost, but a source

---

<sup>3</sup> See *Tariff Filing of Central Vermont Public Service Corp*, Docket 6107, Order of 1/23/01, 211 P.U.R. 4th 53, 69 (January 23, 2001)

1 of capital is required at the start of the project. (Efficiency programs use  
2 screening tools to ensure that an efficiency investment will, in fact, pay for itself  
3 over time.) Further, electric efficiency savings produce a benefit in terms of  
4 reduced utility infrastructure and transmission costs that flow to all ratepayers.

5 Renewable energy generation technologies such as solar photovoltaics  
6 (“PV”), wind power, and farm methane also require substantial up-front capital,  
7 and pay back over many years through electricity sales and reduced  
8 environmental impacts. Owners of such systems benefit from having local (on-  
9 site) renewable sources of electricity; utility ratepayers as a whole can benefit  
10 from having multiple distributed sources of renewable power available within  
11 the service territory.

12 The windfall could be productively used as a source of capital for energy  
13 efficiency or renewable energy projects, leveraging the windfall amount with  
14 other public or private investment to produce economic and environmental  
15 benefits for ratepayers. The windfall’s support for capital could take the form of  
16 loans, incentives, or grants.

17 I’ll take this opportunity to define three terms I will use in describing  
18 these options: incentive, grant, and loan. By an incentive, I mean money  
19 distributed to individuals or businesses as part of an efficiency or renewable  
20 energy project that does not have to be paid back and improves the economics  
21 of the project to the point that the decision-maker for the project chooses to

1 undertake it. Incentives can be custom-designed for a particular project or  
2 prescriptive (a standard fixed value for a common efficiency measure, for  
3 example). By a grant I mean money, commonly distributed through a  
4 competitive process, that does not have to be paid back. A grant is generally  
5 larger than an incentive, and covers a larger fraction of the cost of a project. By  
6 a loan I mean money distributed to those who qualify for it (from an  
7 underwriting or credit-worthiness standpoint) and which must be paid back over  
8 time, with some rate of interest.

9 Windfall-based funding, be it loans, grants, or incentives, could be  
10 established with pre-determined set-asides available for various clean energy  
11 options such as electrical efficiency, thermal efficiency, and renewable energy.  
12 In addition, support for renewables could be tied to efficiency, such as by  
13 requiring that loan recipients have energy audits or take particular actions to  
14 reduce their energy consumption prior to or coupled with any investments in  
15 renewable energy.

16 Loans generally have higher leverage than incentives or grants because  
17 they allow the same dollars to be used more than once. (As a loan is repaid, the  
18 same dollars can be loaned out again.) A loan loss reserve, used to allow  
19 guarantees for clean energy loans, has potential for particularly high leverage  
20 because it reduces the interest rate on loans totaling many times the size of the  
21 reserve; it can also widen the pool of individuals eligible for loans due to the

1           guarantee it provides to lenders. Nevertheless, grants or incentives may be the  
2           only tools capable of benefiting some ratepayers, such as low-income  
3           households or municipal governments, due to their relative inability to rely on  
4           credit.

5    Q.     Please describe some of the options for using the windfall to increase energy  
6           efficiency.

7    A.     The first energy efficiency option to consider is to replicate for CVPS  
8           ratepayers what the Green Mountain Power (“GMP”) Energy Efficiency Fund  
9           has done for GMP ratepayers. The GMP Energy Efficiency Fund (supported by  
10          GMP, the Department, AARP, and others) was the mechanism approved by the  
11          Board and chosen to meet the windfall sharing requirements stemming from  
12          GMP’s acquisition by Gaz Metro.

13                 The GMP Energy Efficiency Fund was implemented via a contract  
14                 between GMP and Vermont Energy Investment Corporation (“VEIC”), which  
15                 operates the Vermont’s statewide efficiency programs. The GMP Energy  
16                 Efficiency Fund has taken the form of providing additional funding that  
17                 “piggybacked” on available Efficiency Vermont funding to increase the  
18                 available incentives and other programs serving the GMP service territory.  
19                 Consistent with the Board order, this funding was divided into residential and  
20                 commercial/industrial portions, in rough proportion to the contributions of these  
21                 sectors through higher rates. This fund has provided benefits to program

1 participants that are greater than the program's costs, thereby achieving the  
2 objective of greater ratepayer value. All of the projects supported by the fund  
3 must be cost-effective, using the societal cost/benefit test approved by the Board  
4 for energy efficiency programs in Docket 5270 and reaffirmed in Docket 5980.  
5 The GMP Energy Efficiency Fund Savings Claim Summary for 2009 is  
6 available online at  
7 [http://psb.vermont.gov/sites/psb/files/projects/EEU/gmpefficiencyfund/2009Fin](http://psb.vermont.gov/sites/psb/files/projects/EEU/gmpefficiencyfund/2009FinalGMPEEFSavingsClaimSummary.pdf)  
8 [alGMPEEFSavingsClaimSummary.pdf](http://psb.vermont.gov/sites/psb/files/projects/EEU/gmpefficiencyfund/2009FinalGMPEEFSavingsClaimSummary.pdf)

9 . This summary documents that, though 2009, this fund had delivered  
10 \$4.41 million in benefits to GMP ratepayers while expending \$1.97 million, for  
11 a benefit-cost ratio of more than 2 to 1.

12 In the GMP program, the return on electric efficiency investment (for  
13 both participants and ratepayers more broadly) is higher for commercial than  
14 residential electric efficiency. Residential energy users in Vermont tend to have  
15 greater opportunities for thermal energy efficiency than electrical, whereas  
16 commercial energy users tend to have greater electric loads and electric  
17 efficiency potential. (Commercial users can also benefit from greater thermal  
18 efficiency, of course.) Moreover, territory and statewide benefits from  
19 commercial electric efficiency can be greater, due to the greater diminishment  
20 of peak load that contributes to suppressing Vermont's share of regional  
21 transmission costs.

1            Learning from the GMP Efficiency Fund, it could make sense to develop  
2            separate programs for commercial and residential energy users that target  
3            particular needs and higher-leverage activities in each sector. It is important to  
4            note that the efficiency environment in the state has changed somewhat since  
5            the GMP Efficiency Fund was established. For example, the budgets for the  
6            electric Energy Efficiency Utilities (“EEUs” – both Efficiency Vermont and  
7            Burlington Electric Department) have increased from about \$30.75 in 2008 to  
8            about \$40.1 million for 2012. As more electric efficiency has been captured, the  
9            “yield,” or the energy savings per dollar of efficiency spending, has fallen. In  
10           combination with the increased EEU budgets, this change in yield means that  
11           windfall funds spent on additional standard EEU activities and incentives (as in  
12           the GMP Efficiency Fund model) would not return as much additional energy  
13           savings as they might have several years ago. Nevertheless, well-targeted  
14           electric efficiency programs extending Efficiency Vermont’s existing programs  
15           and aimed at particular classes of end users would be likely to return significant  
16           benefits to CVPS ratepayers. Thermal efficiency investments, coordinated with  
17           and/or extending programs runs by community action programs and  
18           NeighborWorks of Western Vermont, as well as Efficiency Vermont, would  
19           also be likely to return significant benefits to CVPS ratepayers.

20

1 Q. Must windfall funds used for energy efficiency be used only for electric  
2 efficiency, or could they also be used for thermal efficiency?

3 A. The windfall-sharing requirement does not require that the return of value to  
4 ratepayers must be somehow related to electricity. For example, simple cash  
5 refunds to ratepayers would not be tied directly to electricity or electric  
6 efficiency. This stands in contrast to the electric efficiency charge that funds the  
7 electric EEU's; these monies are explicitly justified as electric charges to fund  
8 electric efficiency.

9           However, the Board Orders regarding the annual plans for the GMP  
10 Energy Efficiency Fund (Dockets 7412, 7492, 7574, and 7687), along with the  
11 Board's Order in Docket 7213 establishing that fund, raise real concerns  
12 regarding use of electric ratepayer funds for thermal efficiency measures. In  
13 practice, efficiency measures conducted primarily for thermal purposes do result  
14 in electric energy savings as well. For example, more efficient furnaces also use  
15 more efficient fan motors, and insulation and air sealing reduce air conditioning  
16 load in addition to heating load. One thing we can learn from the GMP Energy  
17 Efficiency Fund experience is that it has proven hard to find additional cost-  
18 effective electric efficiency measures for residential customers beyond those  
19 already covered by Efficiency Vermont programs. Given our principle that  
20 CVPS ratepayers should receive benefits in rough proportion to their  
21 contributions through rates, finding sufficient electrical efficiency measures to

1 provide real value to residential ratepayers may prove a challenge. Allowing  
2 windfall funds to benefit these households through heating bill savings rather  
3 than electric savings would allow significantly greater benefit to flow to this  
4 ratepayer class.

5 Windfall-funded support for efficiency could cross the barriers that have  
6 been erected between thermal (generally building shell improvements and  
7 fossil-fuel or biomass heating system installations/replacements, with some  
8 electric air conditioning) and electrical efficiency, as well as renewable energy.  
9 For example, incentives or loans supported by the windfall could support  
10 improved insulation and air sealing, installation of a ground-source heat pump,  
11 and rooftop solar PV on a single home. Restricting windfall funds to only  
12 electric benefits unnecessarily limits options that could provide significant  
13 benefits to CVPS customers.

14 Increasing thermal efficiency and the use of renewable energy for  
15 heating Vermont buildings is a substantial challenge, but one the state must  
16 tackle in order to meet the 2011 Comprehensive Energy Plan target of 90%  
17 renewable energy across all sectors by 2050. This requires both dramatically  
18 increased thermal efficiency (with its economic and comfort benefits) and  
19 increased use of renewable fuels (solid biomass or biofuels) and heat pumps for  
20 heating. Efficiency and renewable energy support that could be provided to  
21 CVPS ratepayers as a result of this acquisition and merger could allow

1 comprehensive “whole building” treatment of Vermont’s buildings to the  
2 benefit of CVPS ratepayers and the state as a whole. The lack of robust thermal  
3 efficiency funding and renewable thermal energy measures in Vermont could be  
4 significantly aided by such use, and provide real value to CVPS ratepayers in an  
5 amount greater than the windfall payment itself.

6 Q. What about loans for energy efficiency or renewable energy (together referred  
7 to as “clean energy”)?

8 A. A loan fund could be used for supporting clean energy development. It could be  
9 used to provide low- or zero-interest loans to ratepayers to fund such energy  
10 investments in their homes and businesses. A loan fund would have the  
11 advantage of increasing the suite of tools available to energy consumers,  
12 independent energy consultants, and efficiency providers when approaching the  
13 task of increasing a home or business’s energy efficiency or use of renewable  
14 energy.

15 A loan fund would have the potential to stretch limited dollars further  
16 for the benefit of CVPS ratepayers, through two mechanisms:

17 1) A loan fund can be established in a “revolving” fashion, where loan  
18 repayments from one recipient are then available to be loaned out to another;  
19 this allows each dollar to be used more than once.

1           2) A loan fund can be used to “buy down” the interest rate on a loan procured  
2           through a bank or credit union. For example, if a homeowner borrows \$10,000  
3           of which \$5,000 comes from a bank, with a 6% interest rate, and \$5,000 come  
4           from the loan fund with a 2% interest rate, the net rate paid by the recipient is  
5           4%, and the loan fund has stretched its dollars by a factor of two. The loan fund  
6           could adjust its interest rate and the loan repayment period (and therefore the  
7           amount paid back by the recipient) to account for the needs of particular groups  
8           of customers or technologies, as may be appropriate.

9                     One of the tools available to a loan fund is the ability to house a “loan  
10           loss reserve” fund. This reserve allows the fund to guarantee the loans it issues  
11           in partnership with other financial institutions, lowering barriers to participation  
12           by these institutions and the interest rate they would charge. A loan loss reserve  
13           fund can benefit many loan recipients without actually being expended,  
14           allowing great leverage for these dollars. For example, a Property Assessed  
15           Clean Energy (PACE) loan loss reserve fund (discussed further below) recently  
16           established for this purpose has been capitalized with \$1,000,000.

17                     Depending on how the loan fund is designed and administered, projects  
18           completed using the fund may be good candidates for repayment on the  
19           recipient’s electric bill. This is referred to as “on-bill financing.” On-bill  
20           financing can reduce the administrative barriers to loan recipients and make  
21           repayment easy, without an additional bill to pay each month. Further, the loan

1           may be able to stay with the electric bill should the customer move from the  
2           premises, removing an additional barrier to clean energy investment, where  
3           customers are hesitant to invest because they aren't sure they will reap all of the  
4           long-term benefits of the investment. This mechanism may be especially useful  
5           with renters who otherwise have little incentive to invest in clean energy for  
6           property which they do not own. With appropriate loan terms and cost-effective  
7           efficiency investments, the recipient's average monthly bill can go down – their  
8           energy payments can be structured to fall by more than their loan service  
9           amount.

10    Q.     What is the role of grants in furthering clean energy?

11    A.     Clean energy can also be increased through the use of grants. A competitive  
12           solicitation could rate applications based on energy savings, environmental  
13           impact, cost-effectiveness, comprehensiveness, innovation, or other criteria in  
14           order to ensure that significant benefit is provided from the awarded grants.  
15           Grants are particularly useful in reaching customers, including governments and  
16           schools, for which loans are not effective. For example, a windfall-supported  
17           grant program for such CVPS customers could build on the success of the  
18           Energy Efficiency and Conservation Block Grant (EECBG) program, part of the  
19           American Recovery and Reinvestment Act (ARRA), which provided grants  
20           totaling \$5,082,948 to 130 Vermont municipal and school projects. The  
21           Department received 323 initial applications in response to the solicitation

1            requesting over \$13 million in funding for energy efficiency and renewable  
2            energy projects.

3    Q.    You mentioned PACE. How would a loan fund established with windfall  
4            monies relate to other financing options?

5    A.    Property Assessed Clean Energy (PACE) is available and appropriate for use by  
6            homeowners with significant equity in their homes. Vermont Gas Systems,  
7            through a partnership with a local credit union, makes low-interest loans  
8            available for qualifying customers' efficiency projects. Both the VGS tool and  
9            PACE financing are only available in certain towns or service territories. Home  
10          equity and standard business loans can also be available, although the interest  
11          rates on these financial tools may be high enough to deter their use for clean  
12          energy investments. Some renewable energy developers can provide access to  
13          lease-to-own or other payment-based financing for renewables. VEIC is in the  
14          initial stages of implementing a new loan tool targeted for efficiency in small-  
15          to-medium commercial enterprises, and the Department is working with VEDA  
16          to determine whether this program can be backed in part by Qualified Energy  
17          Conservation Bonds (QECBs). QECBs are tax-advantaged bonds; the money  
18          raised by state or local governments through their issuance must be used to  
19          support clean energy deployment.

20                    A clean energy loan fund serving the entire CVPS service territory could  
21                    make affordable financing available for a wider range of energy consumers than

1 current tools provide. It would be important to take interactions with other  
2 incentives, grants, and loan mechanisms into account when designing the details  
3 of energy-related programs funded by the windfall.

4 Q. What would happen to a revolving loan fund over time? Would such a fund  
5 support only CVPS ratepayers forever?

6 A. While a revolving loan fund could continue to provide loans only to CVPS-  
7 territory projects and customers, the Board could instead decide that  
8 maintaining this distinction forever is not required. Benefits of a loan fund can  
9 be quantified, and after a threshold amount of benefit has accrued to CVPS  
10 ratepayers, the loan fund could be made available to all Vermonters. If this were  
11 to be a part of the windfall design, the Department would expect not only robust  
12 measurement of the ratepayer benefit but also a “return” to CVPS ratepayers  
13 greater than the approximately \$21 million of windfall value prior to use for any  
14 wider purpose. If such a loan fund were one part of a portfolio of tools  
15 supported by the windfall funds, each of which benefits CVPS ratepayers in a  
16 different manner, the determination of the threshold benefit should take into  
17 account the size of the fund and the composition and benefits of the rest of the  
18 portfolio. If the loan fund were charged with supporting low- or zero-interest  
19 loans, its value in real (inflation adjusted) terms could shrink over time, but it  
20 could still provide significant benefits ratepayers for many years into the future.

21

1 Q. Please describe some of the other options for using the windfall funds to  
2 increase use of renewable energy for the benefit of CVPS ratepayers.

3 A. In addition to the loans and grants described above, renewable energy incentives  
4 can also provide ratepayer benefits by increasing the rate of deployment. One  
5 option for the windfall would be to provide funding to support renewable  
6 development within the CVPS service territory. Such funding could be  
7 administered through an existing program such as the Clean Energy  
8 Development Fund (“CEDF”), or a similar entity. For example, the CEDF runs  
9 a small-scale renewable energy program that provides prescriptive incentives to  
10 support the installation of small solar PV, solar hot water, micro-hydro and  
11 wind generators. The windfall funds could be used to increase the incentive  
12 amount or to offer the incentives to a greater number of participants. CEDF has  
13 provided an incentive of \$0.75 per Watt of installed capacity for solar PV. For  
14 scale, this means that \$1 million in incentives supports the development of 1.33  
15 MW of solar capacity, or over 250 typical home-sized (5 kW) solar PV  
16 installations. At the current average solar PV of \$6 per Watt the \$.75 per Watt  
17 incentive would provide a 7-to-1 leverage. That is, \$1 million of incentives  
18 would pair with \$7 million in private investment. Such a program, like all the  
19 others I’ve discussed, could be designed to hold to the principle that residential  
20 and commercial customer sectors would be awarded incentives proportionally  
21 to what they paid in excess rates.

1           Another option for renewable electric generation would be to support  
2 deployment on farms. Methane digesters are a known and established renewable  
3 generation technology on Vermont farms. Farm methane is a distributed  
4 renewable resource that can provide baseload generation (available consistently  
5 around the clock), supporting integration of diverse renewable resources into  
6 the utility's portfolio. Farms may also be well suited to deployment of solar PV  
7 or wind, provided that prime agricultural land is not negatively impacted. One  
8 particular challenge for these sites can be interconnection to the grid; upgrades  
9 can be required to allow two-way energy flow at greater magnitudes than  
10 circuits were originally designed to handle. The costs of interconnection  
11 negatively impact the economics of renewable electricity deployment; support  
12 in the form of loans or grants, funded by the windfall, could make these projects  
13 economically sustainable.

14 Q.    Are there additional benefits that would come from targeting efficiency or  
15 renewables to particular locations in CVPS territory?

16 A.    Yes. Peak-coincident electric energy efficiency and renewable electricity  
17 generation in certain locations on the electric grid provides system-wide  
18 benefits in addition to the economic and environmental benefits from the  
19 projects themselves. For example, in areas where load growth could result in the  
20 need for additional electrical infrastructure (such as redundant power lines or an  
21 additional substation), efficiency and distributed generation could defer these

1 needs, reducing the costs that ratepayers throughout the utility's service territory  
2 would pay for this infrastructure. If windfall-supported efficiency and  
3 renewables were targeted to areas with known transmission or distribution  
4 infrastructure needs, these investments would provide additional benefits to  
5 CVPS ratepayers.

6 Q. Are there particular classes of end users that need different incentives or  
7 programs than standard residential or business customers?

8 A. Yes. In particular, public-serving institutions such as state and municipal  
9 government, schools, and non-profit low-income housing organizations can  
10 have particular hurdles and advantages as targets for energy efficiency and  
11 renewables. Investments in the efficiency of these facilities benefit the broader  
12 community who otherwise would be responsible for paying their energy costs,  
13 and therefore benefit a larger group of ratepayers within CVPS territory. For  
14 example, increasing the efficiency of municipal buildings can allow towns to  
15 spend more money on services (or collect less in taxes), rather than spending  
16 that money on energy. However, these institutions can have a difficult time  
17 accessing the capital necessary to make such investments.

18 As with efficiency, public-serving institutions may benefit particularly  
19 from renewable energy deployment, and require specialized incentives. These  
20 institutions typically have different tax liabilities than for-profit businesses or  
21 homeowners, making federal tax credit support for renewables unavailable. A

1 comprehensive approach to efficiency and renewables in these institutions, with  
2 appropriate low-interest loans or grants funded by the windfall, could provide  
3 substantial benefits to both the institutions and to the taxpayers (who are also  
4 ratepayers) who support them.

5 Q. Are there windfall-sharing options other than energy efficiency and renewable  
6 energy generation that you haven't mentioned yet?

7 A. One additional option would be to use a portion of the windfall to support the  
8 installation of electric vehicle charging infrastructure in the former CVPS  
9 territory. This is enabling infrastructure for both 1) the increased efficiency of  
10 transportation energy use that is possible using plug-in vehicles and 2) the  
11 introduction of greater renewable energy into the transportation sector, because  
12 Vermont's electricity has high renewable content. While public charging  
13 infrastructure might be the most visible infrastructure to support, at the current  
14 level of plug-in vehicle penetration this infrastructure is unlikely to be used  
15 enough to generate significant benefits to ratepayers. Instead, a windfall loan  
16 fund could support the installation of chargers in private homes or businesses  
17 through a low- or zero-interest loan when a plug-in vehicle is acquired. This  
18 would have the effect of lowering the upfront cost to purchase such a vehicle,  
19 serving as an incentive to increase the efficiency and renewable energy use in  
20 Vermont's transportation sector. Electric vehicles, with accompanying  
21 infrastructure, have the potential to benefit ratepayers by moderating the peaks

1 and valleys in load on the electrical grid; this moderation increases  
2 infrastructure utilization.

3 Q. You've described a wide array of potential beneficial uses of the windfall funds.  
4 Would you suggest the full amount of windfall funds be used for any one of  
5 these purposes?

6 A. It is unlikely that the optimal distribution of windfall funds, achieving greatest  
7 ratepayer benefit with the lowest administrative cost and an appropriate  
8 distribution across rate classes, could be achieved through use of only a single  
9 program. In fact, there may be significant benefits for CVPS ratepayers if a  
10 number of potential options were available so that individual ratepayers could  
11 choose the right tool to meet their needs, while also providing system benefits to  
12 all CVPS ratepayers. The purpose of my testimony has been to describe a  
13 number of options, and not to describe or construct the optimal portfolio.

14 **IV. SECTION 248(a)(2) PROMOTION OF THE GENERAL GOOD**

15 Q. In addition to the criteria enumerated in subsection (b), 30 V.S.A. § 248  
16 requires the Board to find that the acquisition will promote the general good of  
17 the state before it approves the current petition.<sup>4</sup> Based on the information you  
18 have reviewed to date in this proceeding, including the issues and concerns  
19 raised by other DPS witnesses, can you conclude that the transaction promotes  
20 the general good of the state?

---

<sup>4</sup> 30 V.S.A. § 248(a)(2).

1 A. Provided that appropriate mechanisms are put in place to advance the VELCO  
2 governance goals set forth in Michael Dworkin's testimony, to address the  
3 financial concerns set forth in John Wilson's testimony, and to ensure the  
4 smooth integration of the two companies as mentioned in Sean Foley's  
5 testimony, yes. The proposed merger of GMP and CVPS presents an  
6 opportunity for increased efficiencies and savings that promise to benefit  
7 ratepayers and the general good of the state.

8 Q. Does that conclude your testimony?

9 A. Yes, it does at this time.
