Hi,

In my opinion the clean heat standard is based on ideology and not common sense. One of the big issues is affordability!!

Can the grid support all electric heat and cars??? What would it cost in money and time to get the grid to support this electrification plan?? As it is right now when we have a hot day in the summer don't do laundry and minimize your electric use until after 8:00 PM!

I get the impression that a group of legislators think they are going to save the world by forcing their ideology onto Vermonters. My question is what about the nearly one billion people in India that use coal fired power plants and the over one billion people in China that has a government that does not care about the environment. Creating undue hardships for 650,000 Vermonters is the answer?? Let's use some common sense and think this through!!

I have two heat pumps and they work great for what my main intentions were.....cooling. They are nice for taking the chill off in an early fall morning but there is a reason why the installer cautioned about using them below 20F. The electric meter spins fast. The other thing is heat pumps are not efficient or stop working at single digit or below zero temps.

Lets properly think this through!!

Regards,
Andy Costello
